

Stanford

Catherine Duarte

Assistant Professor of Epidemiology and Population Health

Bio

BIO

Dr. Catherine Duarte is an Assistant Professor in the Department of Epidemiology & Population Health at Stanford University's School of Medicine. She received her PhD in Epidemiology from the University of California, Berkeley School of Public Health and her Master of Science in Social and Behavioral Sciences from the Harvard T.H. Chan School of Public Health. Duarte's work evaluates upstream drivers of overall risk for, and heterogeneity in, lifecourse health. Specifically, she examines how education and legal system policy and practice exposures in early life may shape population health and health inequity, with an emphasis on cognitive aging and dementia outcomes in midlife and older age. In doing so, her work aims to contribute to systems-level interventions designed to support population health and wellbeing for collective thriving.
