BIO
My work focuses on the application of advanced network methods to the study of complex relational systems in politics and public policy - that is, relationships between political organisations occurring across multiple relational contexts, such as collaboration, communication, discourse, and other co-behaviours, which interact to produce various societal outcomes. I am currently interested in the potentially complementary role of environmental, economic, security, and health crises in social segregation that has been associated with numerous profoundly negative outcomes. I also look forward to setting up an international research agenda to understand the Ecology of Games - decision making across seemingly unrelated political domains - that arguably contributes to the severity and social cost of wildfire.
