Bio

BIO

I'm a a high school senior interested in computational biology, particularly in understanding neurodegenerative diseases such as ALS and Parkinson's. I enjoy exploring how coding and mathematical modeling can help us investigate disease mechanisms and improve our understanding of human health. I'm also interested in the intersection of neuroscience, healthcare, and public health. I speak five languages and enjoy connecting with people from different backgrounds. I'm always open to connecting and especially interested in opportunities to get involved in research and learn from others in the field!
