Bio

BIO

Vasili Razhnou is the Founder and CEO of MEDvidi, a healthcare technology company focused on transforming access to mental health care through AI-powered clinical infrastructure. Under his leadership, MEDvidi has scaled into a multi-million-dollar telehealth platform serving patients across the United States, with a strong focus on operational excellence, provider enablement, and applied artificial intelligence in healthcare delivery.

Vasili's work centers on building AI infrastructure that augments clinicians rather than replaces them. At MEDvidi, he has led the development of a suite of AI systems designed to improve clinical quality, reduce administrative burden, and increase healthcare accessibility. These include real-time AI-assisted chart generation, automated clinical protocol review systems, intelligent patient support agents, and emerging AI prescribing workflows designed with rigorous safety and compliance guardrails.

His approach combines large-scale healthcare operations with practical AI implementation, emphasizing human-in-the-loop systems, clinical reliability, and measurable patient outcomes. Vasili is particularly interested in how AI can modernize healthcare infrastructure by streamlining workflows, improving care consistency, and enabling providers to spend more time focused on patients instead of documentation and administrative tasks.

Prior to MEDvidi, Vasili worked in technology and growth-focused startups, bringing experience in scaling digital platforms, performance marketing, and operational systems. He is passionate about the intersection of AI, healthcare delivery, and behavioral health innovation, and frequently explores how emerging AI architectures can be responsibly deployed in regulated clinical environments.
