Bio

BIO

I am a postdoctoral researcher in the Department of Biochemistry at Stanford University and at the Arc Institute. I received my Ph.D. in Oncology from Zhejiang University. My previous research focused on the interactions between the host innate immune system and pathogens, with an emphasis on elucidating underlying molecular mechanisms and developing therapeutic strategies based on these insights. My current research focuses on understanding the physiological and pathological roles of cGAMP, a key second messenger in the DNA-sensing signaling pathway, across diverse disease models.
