#### BIO

Dr. Shrager assumed the role of Professor and Chief of the Division of Thoracic Surgery in July 2008. He came to Stanford from the University of Pennsylvania School of Medicine where he served as Associate Professor and Chief of Thoracic Surgery at the Hospital of the University of Pennsylvania and Pennsylvania Hospital. He earned his medical degree at Harvard, trained in surgery at Penn, and completed his thoracic surgery training at Massachusetts General Hospital.

Dr. Shrager has been identified as one of "America's Top Doctors" and one of "America's Top Doctors for Cancer" in Castle Connolly's prestigious listings for multiple years running. Dr. Shrager has been awarded US News and World Report "Top Doctor" recognition in every year since that rating system was inaugurated in 2012 ; this award places him among the top 1% of thoracic surgeons nationwide based upon reviews by physician-peers. Evidence of his expert status among his peers also includes membership on the editorial board of the Annals of Thoracic Surgery.

Dr. Shrager practices all aspects of thoracic surgery but has special interest and experience in lung cancer, surgery for emphysema, and mediastinal diseases. His clinical publications reflect these interests. In all cases, he looks towards minimally invasive approaches where appropriate, including VATS (thoracoscopic) lobectomy for early stage lung cancer and transcervical thymectomy.

In the basic research realm, Dr. Shrager has focused upon the responses of the respiratory muscles to various disease states and interventions. His lab's work has been published in important journals such as The New England Journal of Medicine, The Journal of Thoracic and Cardiovascular Surgery, and The American Journal of Respiratory and Critical Care Medicine.

## Research & Scholarship

### CURRENT RESEARCH AND SCHOLARLY INTERESTS

We carry our clinical research regularly on the above topics.

In the wet-lab , we focus on basic and translational work in skeletal muscle atrophy/dysfunction and on EGFR-mutant-driven lung cancer.

On the musce-research side, we were the first to firmly establish the existence of the now widely-recognized clinical problem of ventilator-induced diaphragm atrophy/dysfunction (often termed "VIDD - ventilator-induced diaphragm dysfunction). We then went on using animal models and in vitro analyses to identify some of the pathways involved in effecting this muscle dysfunction. We have now taken that from bench to bedside, with a currently enrolling clinical trial to determine if JAK inhibition will prevent VIDD.

We also have several other ongoing research projects in interesting areas of skeletal muscle dysfunction. These include work using knockout mice to study the role of the miR320 and the Pol3d genes in skeletal muscle, and work toward identifying a treatment for SELENON myopathy using a new invitro cultured muscle cell assay.

On the lung cancer research side, we have designed a CRISPR-based treatment for adenocarcinoma of the lung of the type that frequently occurs in non-smokers, driven by mutations in the EGFR gene. This potential therapy is currently moving into small animal models.
