Bio

BIO

Dr. Jaiswal's lab focuses on understanding the biology of the aging hematopoietic system. As a post-doctoral fellow, he identified a common, pre-malignant state for blood cancers by reanalysis of large sequencing datasets. This condition, termed "clonal hematopoiesis", is characterized by the presence of stem cell clones harboring certain somatic mutations, primarily in genes involved in epigenetic regulation of hematopoiesis. Clonal hematopoiesis is prevalent in the aging population and increases the risk of not only blood cancer, but also cardiovascular disease and overall mortality. Understanding the biology of these mutations and how they contribute to the development of cancer and other age-related diseases is the current focus of work in the lab. These studies utilize genetic and clinical information from large population-based cohorts to understand the impact of clonal hematopoiesis in humans. The effect of the mutations causing clonal hematopoiesis is also studied in human and mouse tissues through a combination of genomic profiling, functional assays, and mouse models of disease.

CLINICAL FOCUS

- Transfusion Medicine
- Genomics and Molecular Pathology
- Anatomic and Clinical Pathology

ACADEMIC APPOINTMENTS

- Assistant Professor, Pathology
- Member, Bio-X
- Member, Cardiovascular Institute
- Member, Institute for Stem Cell Biology and Regenerative Medicine
- Member, Stanford Cancer Institute
- Member, Wu Tsai Neurosciences Institute

HONORS AND AWARDS

- New Innovator Award, National Institutes of Health (2020)

- ASH Scholar Award, American Society of Hematology (2020)
- EvansMDS Discovery Research Award, Evans Foundation (2018)
- Transatlantic Network of Excellence, Foundation Leducq (2018)
- Career Award for Medical Scientists, Burroughs Wellcome Fund (2016)
- BroadIgnite Scholar, Broad Institute of MIT and Harvard (2016)
- Paul E. Strandjord Young Investigator Award, ACLPS (2014)
- Firestone Medal for Excellence in Research, Stanford University (2000)
- Phi Beta Kappa, Stanford University (2000)

PROFESSIONAL EDUCATION

- Medical Education: Stanford University School of Medicine (2010) CA
- Board Certification: Clinical Pathology, American Board of Pathology (2017)
- Fellowship, Harvard Medical School , Transfusion Medicine (2013)
- Residency, Massachusetts General Hospital , Clinical Pathology (2014)
- PhD, Stanford University School of Medicine , Immunology (2010)
- MD, Stanford University School of Medicine (2010)
- BS, Stanford University , Biological Sciences (2000)

PATENTS

- Siddhartha Jaiswal, Irving L. Weissman, Ravindra Majeti, Mark P. Chao. "United States Patent 8562997 B2 Methods of treating acute myeloid leukemia by blocking CD47", The Board Of Trustees Of The Leland Stanford Junior University, Oct 22, 2013

Research & Scholarship

CURRENT RESEARCH AND SCHOLARLY INTERESTS

Somatic Mutations in Aging

Aging is associated with an increased incidence of cancer and several other diseases. As a post-doctoral fellow, Dr. Jaiswal identified a common age-related disorder of the blood characterized by the acquisition of certain somatic mutations in hematopoietic stem cells (Jaiswal et al., NEJM 2014). These mutations allow stem cell clones to expand relative to normal stem cells; this clonal expansion is termed "clonal hematopoiesis of indeterminate potential", or CHIP (Steensma et al., Blood 2015).

The most commonly found mutations in CHIP are in genes involved in epigenetic regulation (DNMT3A, TET2, ASXL1). CHIP is very rare in the young, but becomes common with aging. Between 10-30% of the elderly have a clonal mutation meeting the definition of CHIP. Those with CHIP are at markedly increased risk of developing hematological malignancies such as myelodysplastic syndrome, acute myeloid leukemia, and lymphoma.

Surprisingly, CHIP is also associated with increased risk of atherosclerotic cardiovascular disease, and this relationship is thought to be causal based on mouse models (Jaiswal et al., NEJM 2017). Mechanistically, the mutations in CHIP lead to increased expression of inflammatory gene modules in mature immune cells such as macrophages. These immune effector cells are derived from the mutated hematopoietic stem cells in the marrow, hence they also harbor the CHIP-related mutations.

These observations suggest that somatic mutations in hematopoietic stem cells that arise during aging may have a variety of effects on health. The lab seeks to understand the biology and clinical impact of these mutations, as described in the projects below.

PROJECTS

- Using human population genetics to learn the health associations of clonal hematopoiesis.
- Mechanistic studies on the role of DNA methylation in clonal expansion of stem cells and dysregulated inflammation.
- Characterization of hematopoietic and immune cell subsets from humans with CHIP.
- Identification of novel therapeutics to treat CHIP and/or its associated diseases.
