Research & Scholarship

CURRENT RESEARCH AND SCHOLARLY INTERESTS

I work on the development of machine learning methods to identify structures and systems that promote high quality health care using large databases of electronic health record (EHR) metadata. I am particularly interested on leveraging EHR audit log data to understand and mitigate medical errors. Projects include:

- prediction model for physician burnout from EHR use measures
- computer vision model to define EHR use measures
- identification of inpatient medication errors using EHR audit log data
- unsupervised learning model to identify pediatric patient-centric team members from EHR audit log data
- identification of team and organizational context factors associated with medication errors using EHR audit log data
