#### BIO

Associate Professor of Chemistry Matthew Kanan develops new catalysts and chemical reactions for applications in renewable energy conversion and CO<sub>2</sub> utilization. His group at Stanford University has recently developed a novel method to create plastic from carbon dioxide and inedible plant material rather than petroleum products, and pioneered the study of “defect-rich” heterogeneous electro-catalysts for converting carbon dioxide and carbon monoxide to liquid fuel.

Matthew Kanan completed undergraduate study in chemistry at Rice University (B.A. 2000 Summa Cum Laude, Phi Beta Kappa). During doctoral research in organic chemistry at Harvard University (Ph.D. 2005), he developed a novel method for using DNA to discover new chemical reactions. He then moved into inorganic chemistry for his postdoctoral studies as a National Institutes of Health Postdoctoral Research Fellow at the Massachusetts Institute of Technology, where he discovered a water oxidation catalyst that operates in neutral water. He joined the Stanford Chemistry Department faculty in 2009 to continue research into energy-related catalysis and reactions. His research and teaching have already been recognized in selection as one of Chemistry & Engineering News’ first annual Talented 12, the Camille Dreyfus Teacher-Scholar Award, Eli Lilly New Faculty Award, and recognition as a Camille and Henry Dreyfus Environmental Mentor, among other honors.

The Kanan Lab addresses fundamental challenges in catalysis and synthesis with an emphasis on enabling new technologies for scalable CO<sub>2</sub> utilization. The interdisciplinary effort spans organic synthesis, materials chemistry and electrochemistry.

One of the greatest challenges of the 21st century is to transition to an energy economy with ultra-low greenhouse gas emissions without compromising quality of life for a growing population. The Kanan Lab aims to help enable this transition by developing catalysts and chemical reactions that recycle CO<sub>2</sub> into fuels and commodity chemicals using renewable energy sources. To be implemented on a substantial scale, these methods must ultimately be competitive with fossil fuels and petrochemicals. With this requirement in mind, the group focuses on the fundamental chemical challenge of making carbon-carbon (C-C) bonds because multi-carbon compounds have higher energy density, greater value, and more diverse applications than one-carbon compounds. Both electrochemical and chemical methods are being pursued. For electrochemical conversion, the group studies how defects known as grain boundaries can be exploited to improve CO<sub>2</sub>/CO electro-reduction catalysis. Recent work has unveiled quantitative correlations between grain boundaries and catalytic activity, establishing a new design principle for electrocatalysis, and developed grain boundary-rich copper catalysts with unparalleled activity for converting carbon monoxide to liquid fuel. For chemical CO<sub>2</sub> conversion, the

group is developing C–H carboxylation and CO<sub>2</sub> hydrogenation reactions that are promoted by simple carbonate salts. These reactions provide a way to make C–C bonds between un-activated substrates and CO<sub>2</sub> without resorting to energy-intensive and hazardous reagents. Among numerous applications, carbonate-promoted carboxylation enables the synthesis of a monomer used to make polyester plastic from CO<sub>2</sub> and a feedstock derived from agricultural waste.

In addition to CO<sub>2</sub> chemistry, the Kanan group is pursuing new strategies to control selectivity in molecular catalysis for fine chemical synthesis. Of particular interest in the use of electrostatic interactions to discriminate between competing reaction pathways based on their charge distributions. This effort uses ion pairing or interfaces to control the local electrostatic environment in which a reaction takes place. The group has recently shown that local electric fields can control regioselectivity in isomerization reactions catalyzed by gold complexes.

## ACADEMIC APPOINTMENTS

- Associate Professor, Chemistry
- Senior Fellow, Precourt Institute for Energy
- Member, Bio-X
- Member, Maternal & Child Health Research Institute (MCHRI)
- Faculty Fellow, Stanford ChEM-H

## HONORS AND AWARDS

- Selected one of first annual Talented 12, Chemistry & Engineering News (2015)
- Camille Dreyfus Teacher-Scholar Award, Camille & Henry Dreyfus Foundation (2014)
- Hellman Faculty Scholar Award, Hellman Fellows Program (2013)
- Camille and Henry Dreyfus Environmental Mentor, Camille & Henry Dreyfus Foundation (2012)
- Thieme Journal Award, Thieme Medical Publishers (2010)
- Eli Lilly New Faculty Award, Eli Lilly and Company (2009)

## BOARDS, ADVISORY COMMITTEES, PROFESSIONAL ORGANIZATIONS

- Editorial Advisory Board Member, ACS Central Science (2015 - present)

## PROFESSIONAL EDUCATION

- Postdoc, Massachusetts Institute of Technology , Water-Oxidation Catalysis (2005)
- PhD, Harvard University , Organic Chemistry (2005)
- BA Summa Cum Laude, Rice University , Chemistry (2000)

## LINKS

## Teaching

---

### COURSES

#### 2018-19

- Advanced Organic Chemistry I: CHEM 221 (Aut)
- Organic Chemistry of Bioactive Molecules: CHEM 35 (Spr)

#### 2017-18

- Advanced Organic Chemistry: CHEM 221 (Aut)

- Organic Chemistry of Bioactive Molecules: CHEM 35 (Spr)

#### 2016-17

- Structure and Reactivity: CHEM 33 (Win)
- Synthetic and Physical Organic Chemistry: CHEM 35 (Spr)

#### 2015-16

- Structure and Reactivity: CHEM 33 (Win)

### STANFORD ADVISEES

#### Doctoral Dissertation Reader (AC)

Jeffrey Babicz, Tyler Hernandez, Shyam Iyer, Chris Kalnmals, Alan Landers, Allen Yu-Lun Liang, Shyam Sathyamoorthi, Adam Slavney, Rebecca Smaha

#### Orals Chair

Karen Wang

#### Postdoctoral Faculty Sponsor

Aanindeeta Banerjee, Tyler Porter

#### Doctoral Dissertation Advisor (AC)

Emma Chant, Kyle Disselkoe, Amy Frankhouser, Zhaorui Huang, Andrew Lankenau, Chastity Li, Rain Mariano, Josh Rabinowitz, Don Ripatti
