

Alireza Namayandeh

Postdoctoral Scholar, Earth System Science

Bio

BIO

Dr. Namayandeh is a postdoctoral fellow at the Doerr School of Sustainability at Stanford University. He earned his Ph.D. from Virginia Tech in Environmental Nanoscience/Geochemistry. His research involves the formation and transformation of natural nanoparticles and their reactions with nutrients and contaminants in soils, water, and air and how these reactions impact human health. His Ph.D. work focused on the formation and transformation kinetics of iron oxy-hydroxides and the effects of adsorbed oxyanions such as arsenic, phosphate, and nitrate.

He is currently working on identifying metal-containing particulate matter (PM_{2.5}) formed during California wildfires. He is also involved in solving global and environmental health problems, particularly in low-income countries. He is working on two projects in Bangladesh focusing on lead exposure and the formation of metal-bearing particulate matter in coal-fired brick kilns.

He also holds an MFA in theater from the University of Tehran, Iran, and uses his science and art experience to integrate environmental justice into his research. While attending Virginia Tech, he founded an organization called Art for Environmental Justice (AEJ) to amplify the voices of underrepresented groups impacted by climate change. He is a maker of eco-performance works, and the staged reading of his latest play, Rhino 2020, was performed in Hey Market Theater at Virginia Tech in 2022, which explores the intersection of social extremism and environmental degradation caused by climate change. He is currently working on a project that uses eco-theater to address the environmental justice implications of California wildfires.

HONORS AND AWARDS

- PRISM Baker Fellowship, Stanford University (2022-2023)
- Interdisciplinary Graduate Education Fellowship, Virginia Tech (2021-2022)
- Interdisciplinary Graduate Education Fellowship, Virginia Tech (2018-2019)

STANFORD ADVISORS

- Scott Fendorf, Postdoctoral Faculty Sponsor

Research & Scholarship

CURRENT RESEARCH AND SCHOLARLY INTERESTS

Dr. Namayandeh's research interests are centered around three primary areas: 1) the formation and transformation of natural nanoparticles, 2) their interaction with contaminants and nutrients in the Earth's surface environment, and 3) how these interactions impact human health. He is currently working on identifying toxic metal-containing particulate matter (PM_{2.5}) formed during California wildfires. His research also involved solving global and environmental health problems, particularly in

low-income countries. He is working on two projects in Bangladesh focusing on lead exposure and the formation of toxic metal-bearing particulate matter in coal-fired brick kilns.

He is also interested to integrate environmental justice into his research. He conducts Eco-theater workshops at Stanford, in which participants create performing arts about the social aspects of California wildfires, including the impact on underrepresented groups such as inmate firefighters.
