

Shaghayegh Navabpour

Postdoctoral Scholar, Pathology

Bio

BIO

I grew up in Tehran, Iran, and my fascination with genetics began in middle school when I learned that every living thing is made based on only four nucleotides. This realization sparked my curiosity about how such a simple code could create the diversity of life we see around us. As I delved deeper, I became intrigued by the field of epigenetics and the questions it posed about where the role of genetics ends and epigenetics begins, particularly in the context of developmental and childhood disorders.

My journey in science led me to explore the complex interplay between genetics and epigenetics, focusing on how these processes influence health and disease. Along the way, I also developed a background in neuroscience, which has provided me with a broader perspective on the biological mechanisms underlying human brain diseases and development.

PROFESSIONAL EDUCATION

- Bachelor of Science, University of Tehran , Biology (2014)
- Master of Science, University of Tehran , Physiology (2016)
- Doctoral of Philosophy, Virginia Tech , Neuroscience (2023)

STANFORD ADVISORS

- Gerald Crabtree, Postdoctoral Faculty Sponsor

Research & Scholarship

CURRENT RESEARCH AND SCHOLARLY INTERESTS

My research interests lie at the intersection of genetics and epigenetics, with a current focus on cancer and drug development. I am particularly interested in bifunctional small molecules, such as Transcriptional/Epigenetic Chemical Inducers of Proximity (TCIPs). My work now concentrates on designing, synthesizing, and testing new TCIPs that utilize various transcription factors or histone modifiers to target genes implicated in different types of cancer. Through this approach, I aim to develop innovative therapies that can more precisely and effectively combat cancer, especially to ease the treatment process for vulnerable patients, such as children and adolescents.
