BIO

My research combines advanced data-driven approaches (e.g., GeoAI and causality inference), process-based terrestrial biosphere/Earth system models, and big datasets and techniques of remote sensing, in-situ measurements, geographical information science (GIS), and high-performance computing, to investigate critical processes related to natural greenhouse gas emissions (e.g., CO₂ and CH₄) and nature-based climate solution, wildfire-human-climate interactions, human-environment interactions, and biosphere-atmosphere interactions of carbon-water-energy fluxes affecting climate change.
