Bio

BIO

Stroke is the leading cause of disability in the United States, drastically disrupting the lives of stroke survivors and their caretakers. Unfortunately, because of tight therapeutic time requirements, the majority of stroke patients are not eligible for the current medicines or interventions. The George Lab's research focuses on improving stroke diagnostics as well as engineering new methods to enhance stroke recovery. Our lab's primary focus is applying novel bioengineering techniques to understand the mechanisms of neural recovery (primarily in stroke) and discovering methods to improve patient recovery. We use rodent models of stroke combined with biomaterial techniques, stem cell transplants, and microfabrication to achieve these aims and evaluate our methods with behavior testing and various imaging techniques. Our ultimate goal is to translate these findings into clinical trials to help stroke patients.

CLINICAL FOCUS

- Neurology

ACADEMIC APPOINTMENTS

- Assistant Professor - Med Center Line, Neurology & Neurological Sciences
- Assistant Professor - Med Center Line (By courtesy), Neurosurgery
- Member, Bio-X
- Member, Cardiovascular Institute
- Member, Wu Tsai Neurosciences Institute

ADMINISTRATIVE APPOINTMENTS

- Neuroscience PhD Program Representative, Committee on Graduate Admissions and Policy, (2017- present)

BOARDS, ADVISORY COMMITTEES, PROFESSIONAL ORGANIZATIONS

- Science Committee, American Academy of Neurology (2013 - present)

PROFESSIONAL EDUCATION

- Internship: Stanford University Internal Medicine Residency (2009) CA
- Fellowship: Stanford University Vascular Neurology Fellowship (2013) CA
- Residency: Stanford University Neurology Residency (2012) CA
- Board Certification: Vascular Neurology, American Board of Psychiatry and Neurology (2014)
- Board Certification: Neurology, American Board of Psychiatry and Neurology (2012)
- Medical Education: Harvard Medical School (2008) MA
- PhD, Massachussetts Institute of Technology , Electrical and Medical Engineering (2005)
- BSE, Tulane University of Louisiana (1999)

Research & Scholarship

CURRENT RESEARCH AND SCHOLARLY INTERESTS

CONDUCTIVE POLYMER SCAFFOLDS FOR STEM CELL-ENHANCED STROKE RECOVERY:

We focus on developing conductive polymers for stem cell applications. We have created a microfabricated, polymeric system that can continuously interact with its biological environment. This interactive polymer platform allows modifications of the recovery environment to determine essential repair mechanisms. Recent work studies the effect of electrical stimulation on neural stem cells seeded on the conductive scaffold and the pathways by which it enhances stroke recovery Further understanding the combined effect of electrical stimulation and stem cells in augmenting neural repair for clinical translational is a major focus of this research going forward.

BIOPOLYMER SYSTEMS FOR NEURAL RECOVERY AND STEM CELL MODULATION:

The George lab develops biomaterials to improve neural recovery in the peripheral and central nervous systems. By controlled release of drugs and molecules through biomaterials we can study the temporal effect of these neurotrophic factors on neural recovery and engineer drug delivery systems to enhance regenerative effects. By identifying the critical mechanisms for stroke and neural recovery, we are able to develop polymeric technologies for clinical translation in nerve regeneration and stroke recovery. Recent work utilizing these novel conductive polymers to differentiate stem cells for therapeutic and drug discovery applications.

APPLYING ENGINEERING TECHNIQUES TO DETERMINE BIOMARKERS FOR STROKE DIAGNOSTICS:

The ability to create diagnostic assays and techniques enables us to understand biological systems more completely and improve clinical management. Previous work utilized mass spectroscopy proteomics to find a simple serum biomarker for TIAs (a warning sign of stroke). Our study discovered a novel candidate marker, platelet basic protein. Current studies are underway to identify further candidate biomarkers using transcriptome analysis. More accurate diagnosis will allow for aggressive therapies to prevent subsequent strokes.

CLINICAL TRIALS

- Imaging Collaterals in Acute Stroke (iCAS), Recruiting
- Transient Ischemic Attack (TIA) Triage and Evaluation of Stroke Risk, Not Recruiting

Teaching

STANFORD ADVISEES

Postdoctoral Faculty Sponsor

Shang Song

Doctoral Dissertation Reader (NonAC)
