CURRENT RESEARCH AND SCHOLARLY INTERESTS

As a postdoctoral research fellow in the laboratory of Mark Schnitzer I am utilizing chronic, in vivo, fluorescence calcium-imaging combined with chemo and optogenetic manipulations to determine the mechanisms by which neuronal circuits and the ensembles of cells within them enable the encoding and recall of context-dependent memories. Memories are often constructed from associations between diverse pieces of information that have no intrinsic connection. By studying how disparate pieces of information are stored in relation to each other before and after a learning event, I hope to shed light on the mechanisms by which memories are formed in the mammalian brain. Ultimately, this research will facilitate our understanding of how higher order knowledge is synthesized and extracted from information in the brain.
