### CURRENT RESEARCH AND SCHOLARLY INTERESTS

Susan McConnell is the Susan B. Ford Professor in the Department of Biological Sciences at Stanford University. She joined the Stanford faculty in 1989. McConnell has studied the development of the cerebral cortex, the brain region that controls our highest cognitive and perceptual functions. The nerve cells of the cortex are generated during fetal life; once these cells are born, they migrate over long distances before forming connections with other nerve cells. McConnell has explored the mechanisms by which young neurons acquire an identity and establish specific connections. Her studies provide insights into the process of how the brain wires itself up during normal development. PLEASE NOTE: The McConnell lab is now closed and is no longer accepting students or postdoctoral fellows.
