1. California Instituted for Regenerative Medicine (CIRM) Early Translational IV Awards Preliminary App \$1.2M/yr x 3 yrs. Principal Investigator: Peltz, Gary. Project to develop a method to convert adipocyte-derived stem cells into hepatocyte-like cells (chi-Heps) using a totally chemically defined media, and have demonstrated that chi-Heps can reconstitute human liver in a murine experimental model, which mirrors the procedures used in clinical medicine. The goal is to use adipose tissue to enable human liver regeneration via transplantation of autologous stem cells.
